Armenotech Limited

Cyprus

Dear Hiring Team,

I've spent the last six years writing Go for production systems, and the past year or so doing it in a context that looks a lot like yours — high-volume transaction processing, regulatory pressure, and infrastructure that can't go down.

Right now I'm a senior Go engineer at Platform Builders, working on a distributed system that processes 140M+ transactions per month for Brazil's largest pharmaceutical retailer. I've fixed concurrency bugs in Kafka consumers under real load, migrated a database layer from Oracle to PostgreSQL without taking the system offline, and reworked goroutine patterns that cut latency by 40%. The whole stack runs on Docker and Kubernetes with CI/CD, and I've owned those pipelines end to end.

The Stellar protocol work is what got me looking at Armenotech. I've already built in this space — zkSettle is a compliance layer I wrote for stablecoin fintechs on Solana, handling travel-rule and sanctions checks without putting user data on-chain. I also built Pattpay, a payment gateway with recurring billing on Solana, and a dark pool DEX with batch auction settlement. So the fintech and blockchain side isn't aspirational for me, it's what I've been doing.

On Go specifically: I use modules, code generation, and templating daily. I write Godoc that people actually reference. I think in goroutines and channels. I've used pprof and delve to track down production issues, and the race detector is part of my regular workflow. I'm also comfortable with SQL — I've optimized queries across PostgreSQL, SQL Server, and MongoDB in production.

I've mentored five engineers on concurrency and distributed systems, and our team velocity went up 30% that quarter. I've run 20+ workshops for 60+ developers on blockchain architecture. I've been remote since 2025 and work well independently — async communication, written documentation, self-directed work are all things I do without thinking about it.

On the open source side, I have 19 merged PRs to the Zed editor (70k+ stars, Rust), across 15+ subsystems. It's where I stay sharp on systems-level work outside my day job.

Happy to talk more about any of this whenever works for you.

Best regards,

João Roberto Lawall Soares
