OneSignal

Senior Software Engineer – Analytics Team

Hi,

I'm applying for the Senior Software Engineer position on OneSignal's Analytics team. I've spent 6+ years building backend services in Go and Rust, and the combination of your scale (1.3T messages/year), your stack (Rust, Go, Kafka, Kubernetes), and the problem space – turning messaging data into something customers can act on – is exactly where I want to be working.

At my current role, I work on a system that processes 140M+ monthly transactions through Apache Kafka. I tracked down a concurrency bug in the consumer pipeline that was causing duplicate invoices and fixed it with mutex-based synchronization. Zero downtime, no data loss. I also migrated our database layer from Oracle to PostgreSQL, which involved rewriting query plans and adding indexes that cut our slowest queries by over a minute. These are the kinds of problems I like: high-throughput distributed systems where getting the details wrong costs real money.

On the Rust side, I contribute to the Zed code editor (70k+ GitHub stars). I've had 19 PRs merged across 15+ subsystems – fixing a deadlock in the rendering framework, debugging terminal layout issues caused by floating-point precision, reworking selection logic across 11 files. It's given me a solid feel for large Rust codebases and the kind of careful systems thinking that comes with them.

I use AI tooling heavily in my daily work. I built Auto-Issue, a Go application that takes GitHub issues, routes them to AI agents (Claude Code, Codex, or Gemini), and produces PRs with self-reviewed code. The backend handles orchestration, work queues, concurrency limiting, and git worktree isolation per issue. I also use Claude Code, Cursor, and Codex throughout my regular development workflow for code generation, reviews, and testing.

I've deployed and monitored services on Docker and Kubernetes, participated in on-call rotations, and written technical design documents for new features. I've worked with PostgreSQL and MongoDB extensively, including query optimization that brought an 85% improvement on MongoDB aggregation pipelines. I design RESTful APIs and gRPC endpoints, and I follow clean architecture principles without being rigid about it.

Happy to talk more about how my background fits what you're building on the Analytics team.

Best regards,

João Roberto Lawall Soares
